

# Alternate Pi-Demos Simulators

COMP 522  
Project

Presented by  
**Eugene Syriani**

# Words on Graph Grammars

- LHS vs RHS
- Execution: Match -> Transform (create + remove + set values)
- Denotational vs Operational semantics

# The Operational Semantics

- Architecture: underlying DEVS system
- Design: “plug-in” for AToM<sup>3</sup>
  - Modularity of rules
- Testing: trace comparison

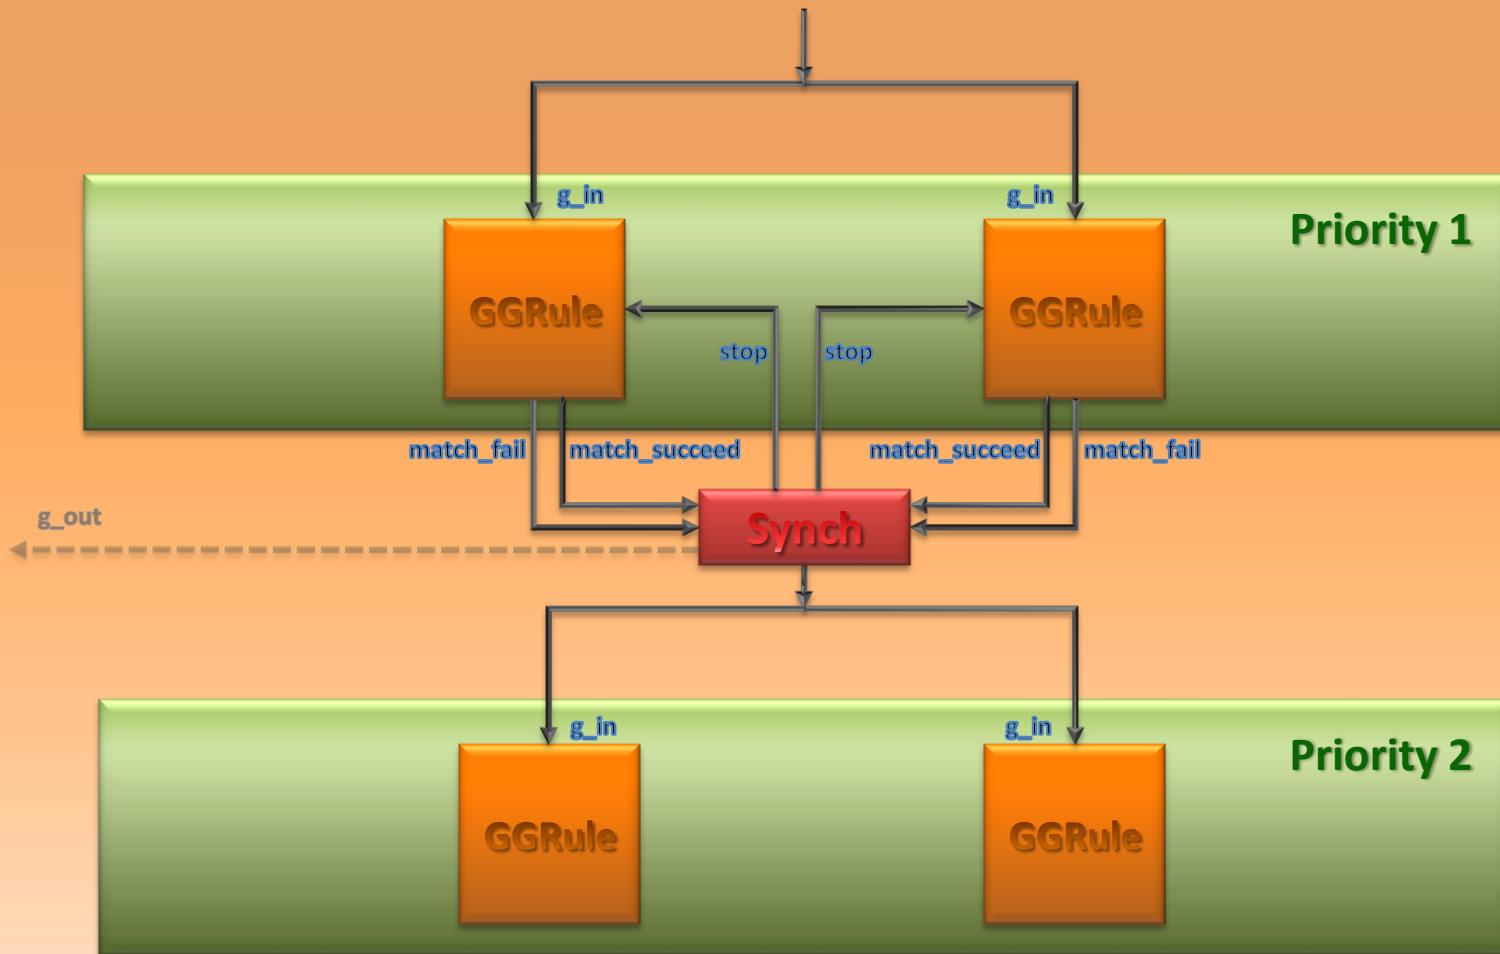

# GGRules

# GGRules

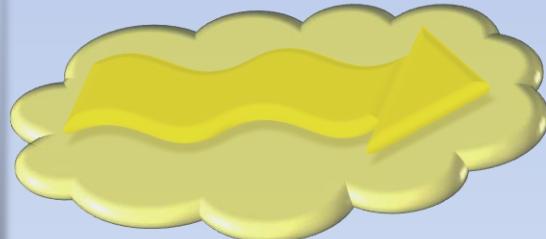

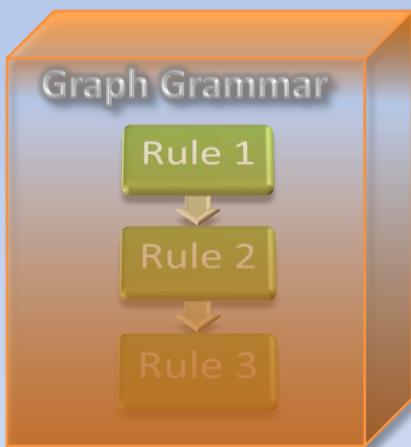

# GGRules

# Template-style code for GG

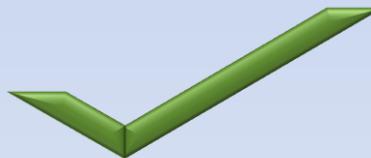

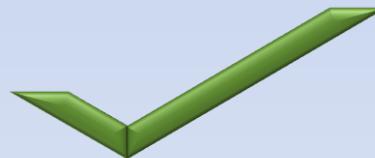

- Rule: Abstract super-class
- Execute method:
  - Find matching subgraph: get each node, filter for specific attributes, filter by links
  - Transform subgraph: remove nodes, create nodes, set attribute values

# Conclusion

A 3D dark blue rectangular block labeled "CODE". Inside, there is a block of Python-like pseudocode:

```
for sub g.listNodes:  
    if match(sub):  
        sub = execute()  
    return sub
```

I am convinced that it is doable!
