Basics

Conditionals

Loops

Advanced

Exercises

Shell scripts

- Grouping commands into a single file
 - \rightarrow Reusability
- Possible to use programming constructs
 - Variables
 - Conditionals
 - Loops
- No compilation required

Creating a shell script

- 1. Save the script as a (.sh) file
- Add the line '#!/bin/bash' (or #!/usr/local/bin/bash on radix) to the beginning of the script
 - '#!' indicates that the file is a script
 - '/bin/bash' is the shell that is used to execute the script
 - When the script is executed, the program after the '#!' is executed and the name of the script is passed to it
 - ► Since the line starts with a '#' it is ignored by the shell
- 3. Make the script executable using 'chmod +x'
- 4. Execute the script by calling it
 - Put './' in front of the name in order to avoid confusion with commands

Comments

- Comments are placed behind a # and last until the end of the line
- ▶ There are no multiline comments
- ▶ The #! line is a comment

Variables

- Setting variables
 - VARIABLE=value
 - ► No spaces before and after the '='
- Using variables
 - ▶ Place a '\$' before the name
 - If the variable name is followed by text → place the name between braces
 - ► E.g.: echo "Today is the \${DAY}th day of the week"
- Waiting for keyboard input
 - read VARIABLE
- Exporting variables
 - ▶ To make them accessible from other programs
 - ▶ Place 'export' before the name of the variable
 - ► E.g.: export PATH='/bin:/usr/bin'

Special variables

- \$0 Expands to the list of positional parameters, separated by commas
- **\$#** The number of positional parameters
- \$0 The name of the script
- \$1, ..., \$9 The nine first positional parameters
 - \$? The exit status of the last executed command
 - \$! The PID of the last process that was started in the script
 - \$RANDOM A positive random integer

Example

- nano script.sh
 #!/bin/bash
 name='whoami'
 echo Hello \$name !
- Execute:
 chmod +x script.sh
 ./script.sh

Conditions

- ▶ Between [. . .]
- Spaces before and after []
- Examples
 - ▶ [-d dir] returns true if dir is a directory
 - ▶ [\$var -eq 2] returns true if \$var equals 2
 - [\$var -eq 1] || [\$var -eq 2] returns true if \$var equals 1 or 2

Conditions - Files

- -e File exists
- -d Is a directory
- -f Is a regular file
- -r Is readible
- -w Is writeable

Conditions - Strings

- -n Length of string is nonzero -z Length of string is zero s1 = s2 s1 and s2 are identical
- s1 != s2 s1 and s2 are not identical

Conditions - Numbers

```
i1 -eq i2 i1 and i2 variables are equal
i1 -ne i2 i1 and i2 variables are not equal
i1 -gt i2 i1 is greater than i2
i1 -ge i2 i1 is greater than or equal to i2
i1 -lt i2 i1 is less than i2
i1 -le i2 i1 is less than or equal to i2
```

Conditions - And, or, not

- ! negation (NOT) operator
- && AND operator
- || OR operator

If statements

```
if [ $# -ne 1 ]
then
    echo Please specify your name
elif id $1 > /dev/null
then
    echo Hello $1
else
    echo I don\'t know you
```

If statements

- Zero or more elif clauses are possible
- ▶ The else clause is optional
- ▶ The if body is executed if the exit status of the condition is 0

Case statements

Case statements

- Executes code based on which pattern matches a word
- Multiple cases can be specified per block by separating them using '|'
- Each block has to be terminated by a ';;'
- ▶ Use '*' to match 'the rest'
- If multiple cases match, the first one is executed

For loops

```
for FILE in 'ls /bin'
do
    echo "Creating link to $FILE..."
    ln -s /bin/$FILE
done
```

For loops

- The list can be
 - ► A literal list: a b c
 - ► A glob pattern: *.jpeg
 - ► The output of a command: 'ls -a'
- The body is executed for each element in the list
- The Loop variable is set to the value of the current word

While and until loops

```
while [ -f file.txt ]
do
     echo file.txt still exists... Please remove it
     sleep 5
done
```

While and until loops

- ▶ The condition is evaluated on each iteration
- While loops are executed as long as the exit status of the condition is zero
- Until loops are executed as long as the exit status of the condition is not zero

Break and continue

```
for I in 'seq 10'
do
   if [ $I -eq 3 ]
   then
       echo Skipping 3...
      continue
   fi
   if [ $I -eq 7 ]
   then
      echo Stopping at 7...
      break
   fi
   echo The square of $I is $((I*I))
done
```

Break and continue

- break causes a loop to be exited immediately
- continue causes a loop to continue with the next iteration
- ► An integer parameter can be specified to continue or break from the *n*th enclosing loop
 - 'break 2' will break from the second enclosing loop
 - 'continue 1' is the same as 'continue'

Arithmetic

- Arithmetic can be performed between ((and))
- Only operations on integers are possible
- ▶ The exit status is 0 when the result of the expression is not zero and 1 if the result of the expression is zero
- ► An expression between \$((and)) expands to the result of the expression.
- ▶ For more advanced calculations bc can be used.

Arithmetic

```
A=$RANDOM
B=$RANDOM
C=$A
D=$B
while ((D != 0))
do
    TEMP=$D
    D=$((C % D))
    C=$TEMP
done
echo "The GCD of $A and $B is $C"
```

Functions

- Functions behave the same as commands
- ► The exit status of the function is the exit status of the last executed process
- Parameters are placed in variables \$1, ..., \$9
- Use 'return' to exit from the function early
- Use the 'local' keyword to make local variables
