Unit Testing \rightarrow for every requirement, create a test

Sanity test is good for checking Identity, accuracy & rounding.

Good Unit Tests:

- 1) No human \rightarrow automatic
- 2) Pass/Fail \rightarrow binary answer
- 3) Run in isolation 1 REQ \rightarrow 1 test \rightarrow Pass/Fail

\therefore Test exactly 1 feature

If you test more than 2 features, if a test fails, we can't tell which test failed: need human \rightarrow not good.

Remember: `python -v file.py ~v` \nwarrow this is verbose for file.py
this is verbose
for python
