

Architecture : Software → Hardware

Package Diagram

Components

Groups an idea together. This will have some networking, arithmetic, ... to accomplish this idea/service.

Hardware : diagram to depict physical constraints
 (ie: network in a company, draw a workstation connected to a dep't server which is connected to a company server)

Deployment diagram: to link Hardware & Components

So, we link components by drawing them in the hardware pieces. (ie: in workstation, draw component (network card) with a TCP-IP link to network card of dep't server).

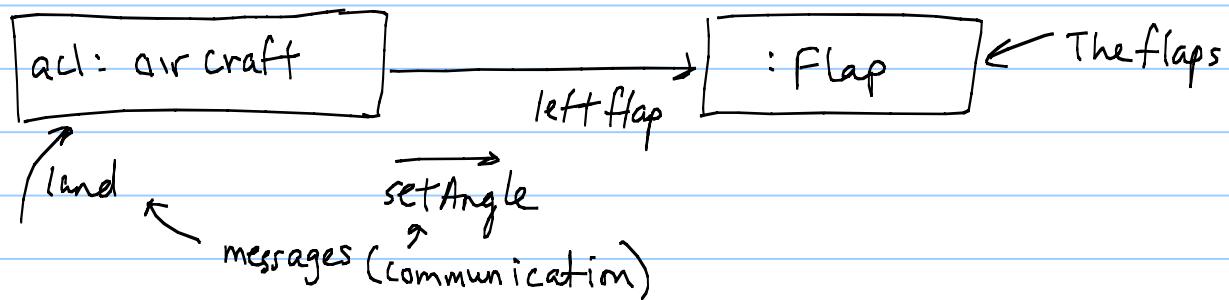

Interaction a) communication \leftrightarrow equivalent diagrams
b) sequence

All about run-time dynamics (focus on interaction only!)

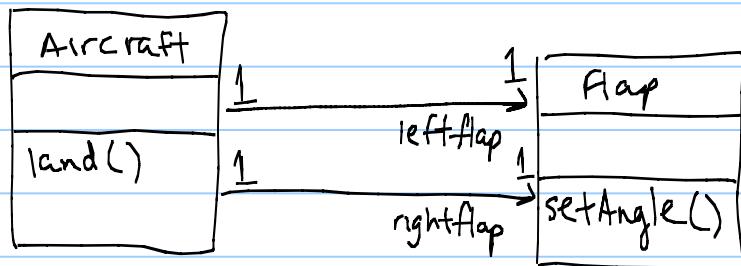

One trace of behaviour \sim use case (behaviourally related sequence of transactions in a dialogue w/ a system.

(ie: What exactly happens when a human goes to the ATM?)

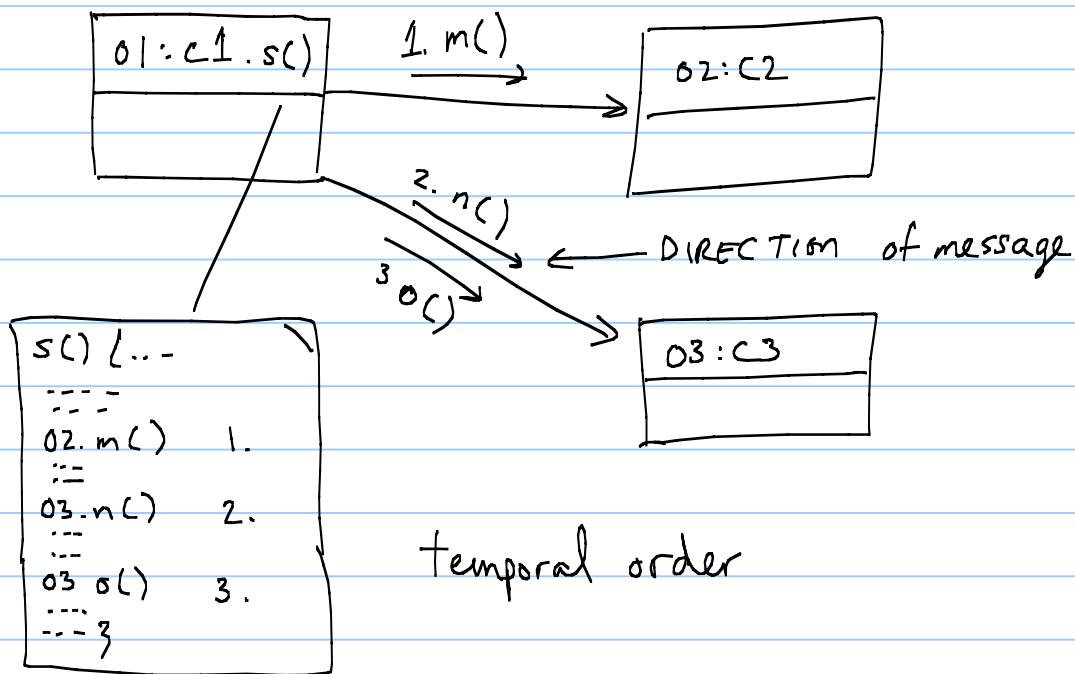

a) communication diagram (use object diagram)

Class diagram :

Sequence Diagram:

Class diagram, there should be an association between classes that communicate.
