

# Unified Modelling Language (UML)

many notations

OCL = object constraint language

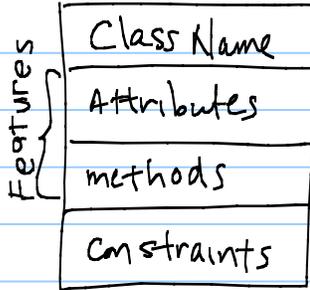

UML is used thru whole process :  
req's, analysis, design, deployment

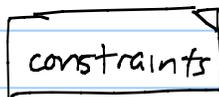

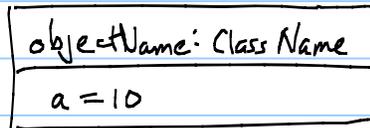

# Classes

**ClassName** ← upper Camel/Case

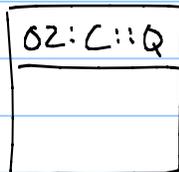

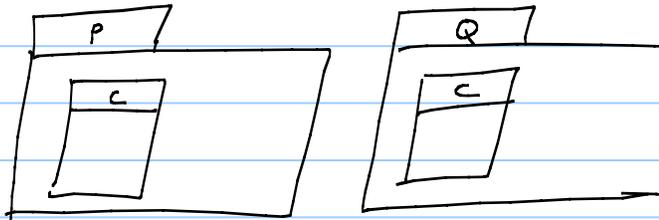

objectName ← lower camel case

↑  
or  
with a note

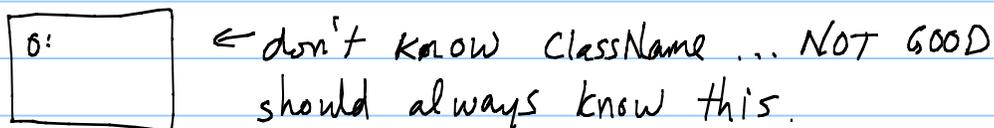

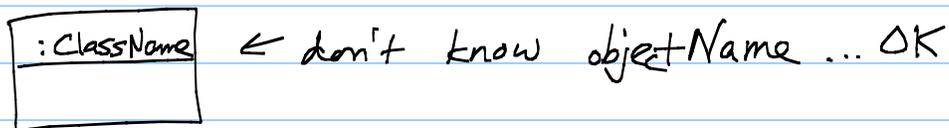

Packages:

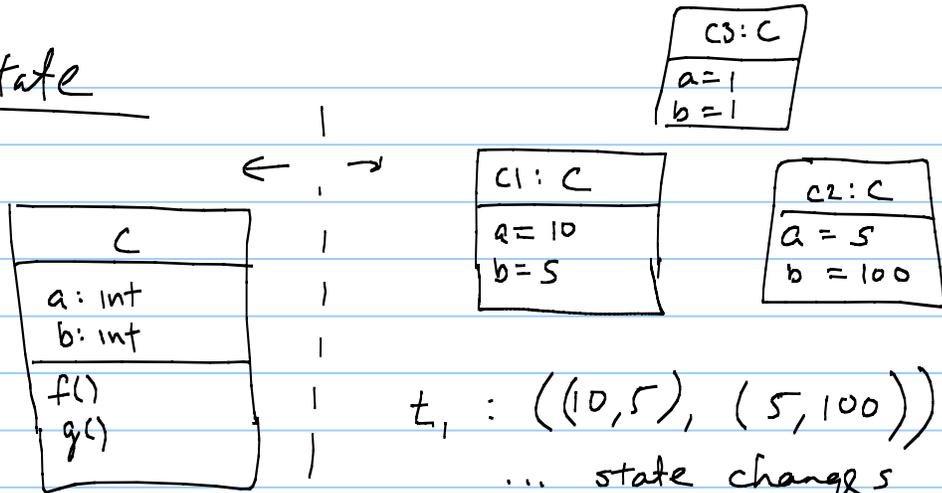

O2: C  
↑  
object is of type C

C::P ← class C is part of package P

# State

Snapshots

At

$t_2 : ((11, 5), (4, 100))$

$t_3 : (4, 100)$

$t_4 : ((4, 100), (1, 1))$

$t_2$ : increment or decrement "a"

$t_3$ : delete C1

$t_4$ : create C3

## Cause of Change:

- Obj. sends msg to other obj.
- Method Call
  - attribut change
  - send msg
  - creation/deletion of obj

Visibility: r:

slashed means "derived" attribute

r: gettable, not settable
