Design (Space Exploration) as a service

### Boric Acid Transportation Pump

#### Product parameters

Design standards : RCC-M

Flow : 16.6m<sup>3</sup>/h

Head : 85m

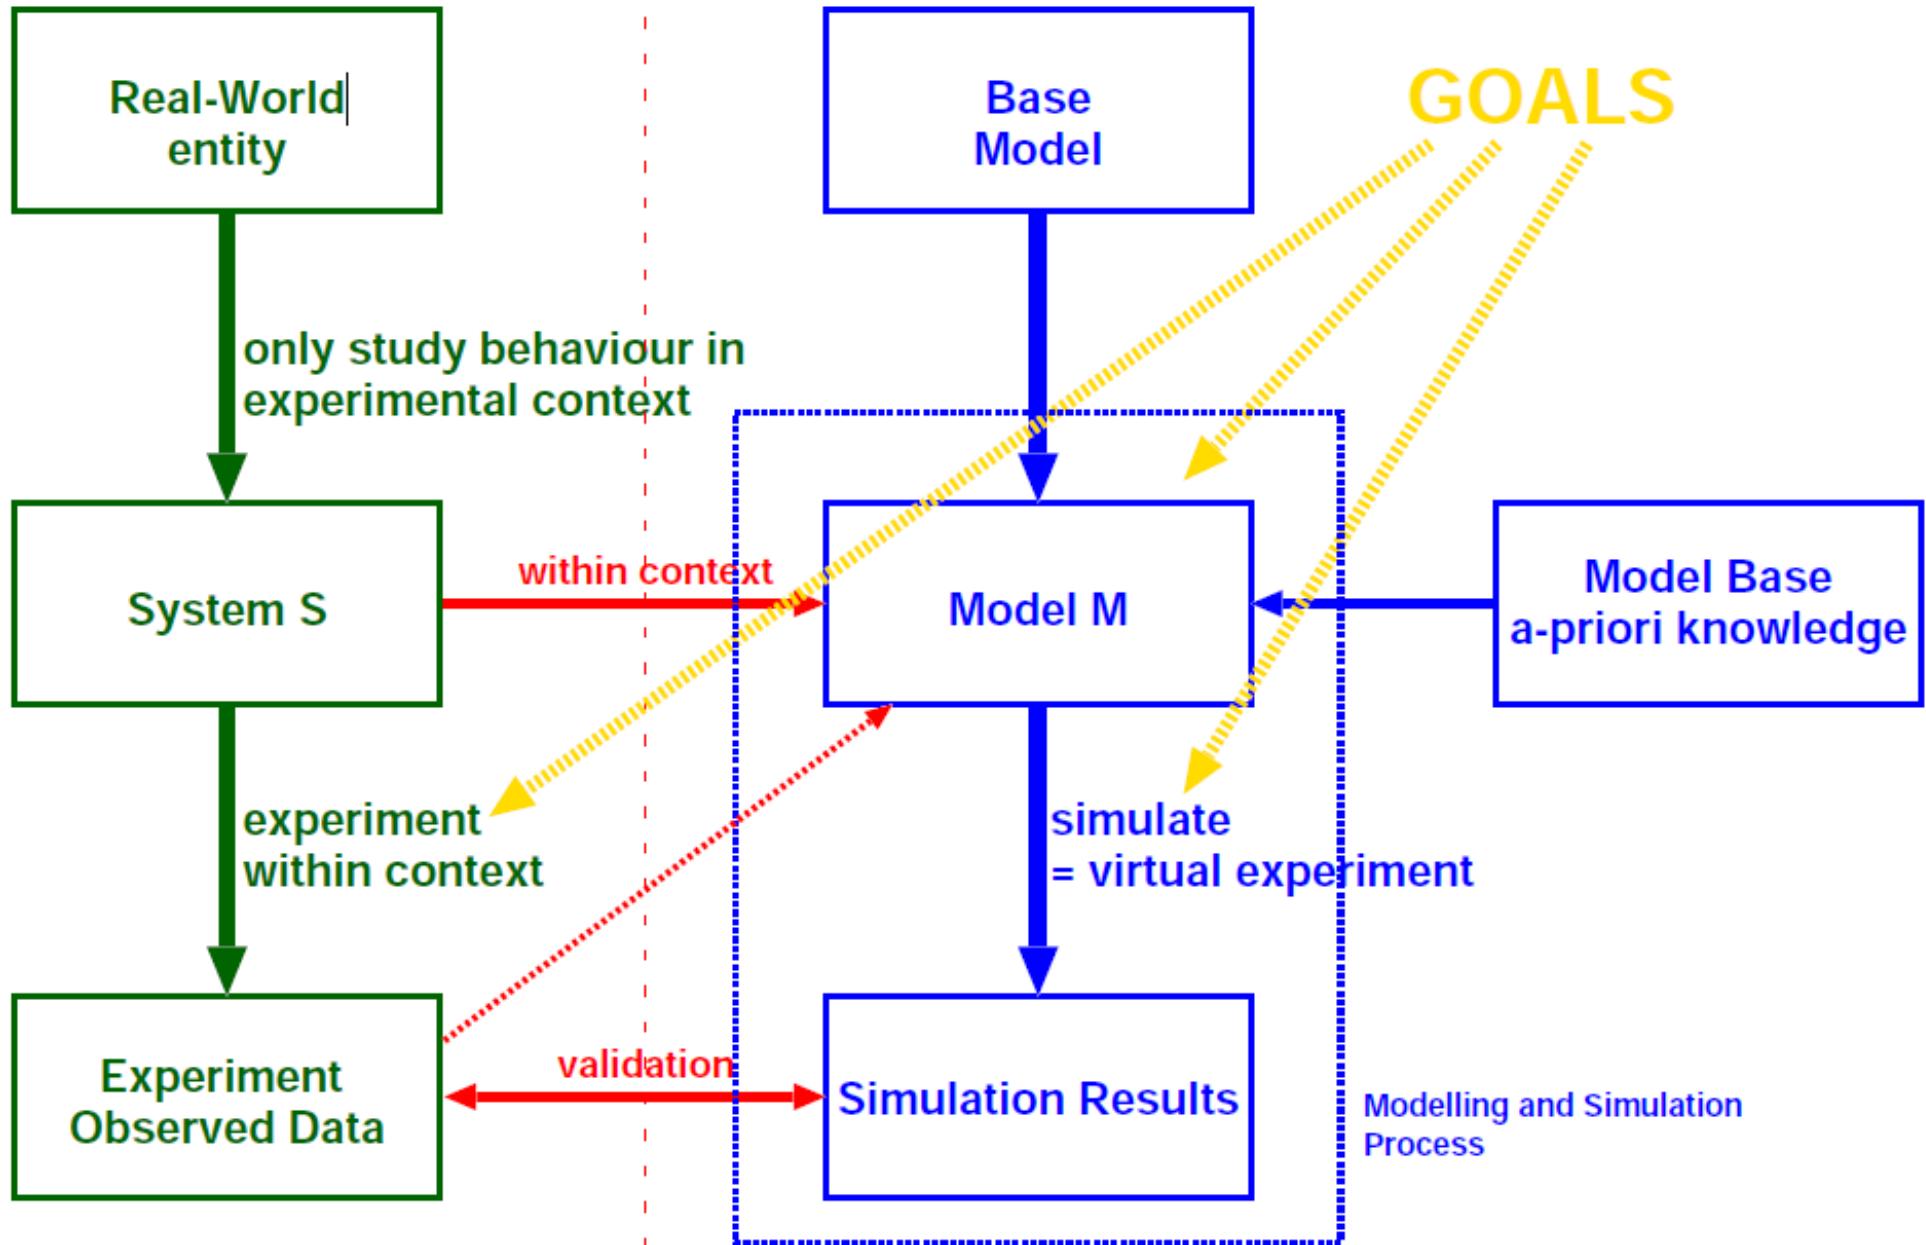

Temperature : ~80°C

Pressure : 1.6MPa

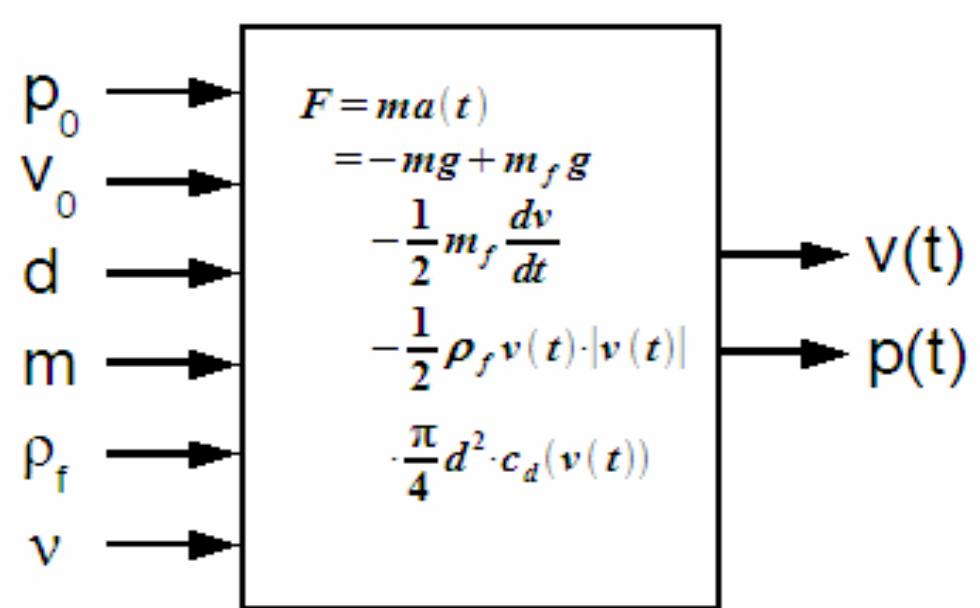

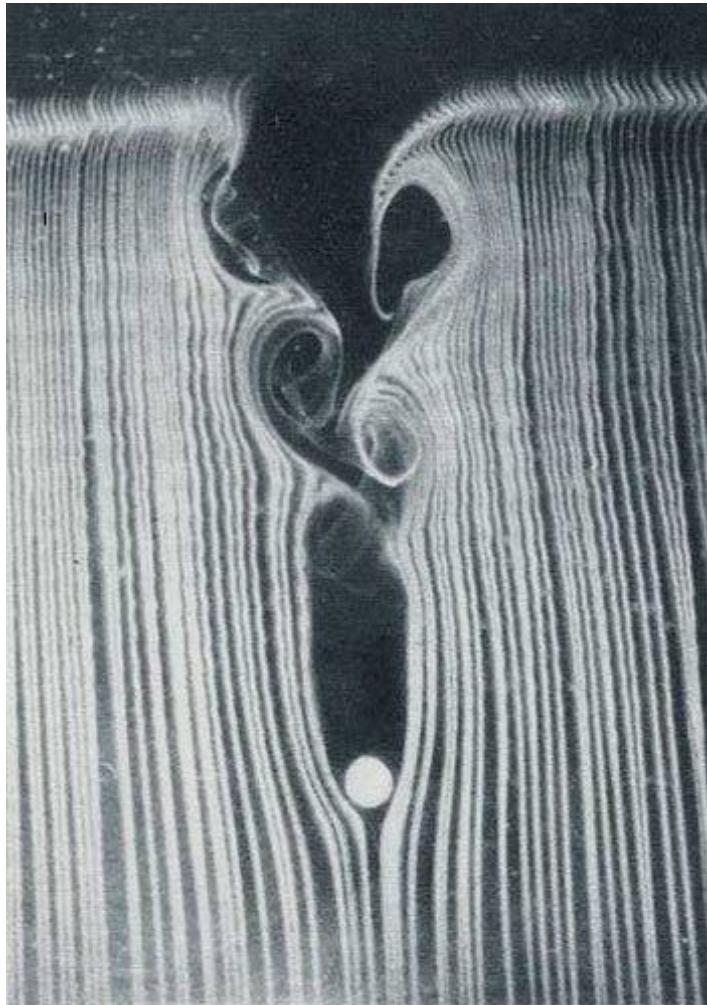

Used in 600MWe 、 900MWe 、 1000MWe PWR nuclear power plant boric acid transportation system.

# REALITY

# MODEL

# Model Validity ... Context?

Spiegel, M., Reynolds, P. F., & Brogan, D. C.  
A Case Study of Model Context for Simulation Composability and Reusability.  
In *Proceedings of the Winter Simulation Conference, 2005*. (Vol. 2005, pp. 437–444). IEEE.  
<http://doi.org/10.1109/WSC.2005.1574279>

## 1. Invariant Constraints

### 1a Sphere Attributes

1. Sphere Property - The body is a sphere and it remains spherical.
2. Smooth Property - The body is smooth and it remains smooth.
3. Impermeable Property - The body is completely impermeable.
4. Initial Velocity - The body has an initial velocity of  $v_0$  that has no horizontal component of motion.
5. Angular Velocity - The body has no initial angular velocity.
6. Constant Mass - The mass of the body remains constant over time. The body does not experience ablation or accretion.
7. Constant Diameter - The diameter of the body remains constant over time.
8. Distribution of Mass - The body has a centrally symmetric mass distribution that remains constant over time.
9. Uncertainty Principle - The diameter of the body is much greater than the Plank length.
10. Brownian Motion - The mass and diameter of the body are large enough such that Brownian motion of the fluid has negligible impact on the body.
11. General Relativity - The mass of the body is low enough to ignore the gravitational curvature of space-time.

## Implicit Assumptions!

### 1c Earth Attributes

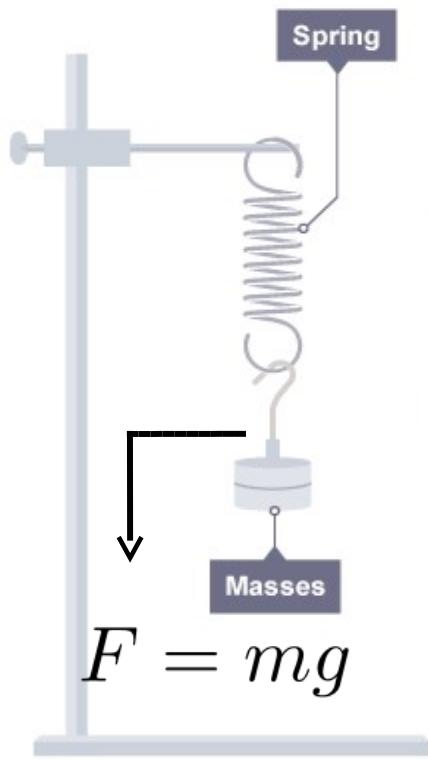

18. Flat Terrain - The ground does not have terrain and remains flat for all  $t > 0$ .
19. Coriolis Effect - The Earth is not rotating. We ignore the Coriolis effect.

### 2. Dynamic Constraints

20. Mach Speed - The velocity of the body is sufficiently less than the speed of sound for that medium.
21. Special Relativity - The velocity of the body is sufficiently less than the speed of light for that medium.
22. Reynolds Number - The Reynolds number remains between  $10^{-2}$  and  $10^7$  for all  $t > 0$ . The Reynolds number is a function of velocity.

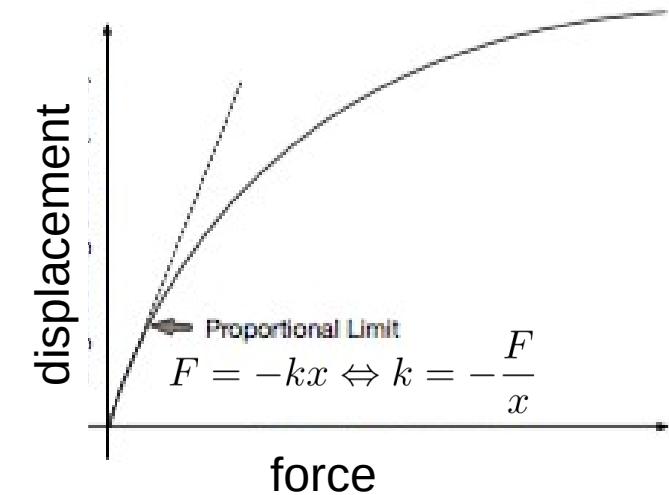

### 3. Inter-Object Constraints

23. Sphere/Fluid Interaction - The body and the fluid interact only through buoyancy and drag. For example, the body cannot dissolve in the fluid, nor can the body transfer heat to the fluid.
24. Sphere/Earth Interaction - The body and the earth interact only through the gravitational force.
25. Fluid/Earth Interaction - The fluid and the earth do not interact.
26. Closed System - The Earth, sphere, and fluid do not interact with any other objects.
27. Simple Gravity - Gravity is a constant downward force of  $9.8 \text{ m/s}^2$ .
28. One-Sided Gravity - The mass of the body is much less than the mass of the Earth. The Earth is not affected by the gravitational pull of the body.
29. Inelastic Collision - The collision between the sphere and the ground is perfectly inelastic.

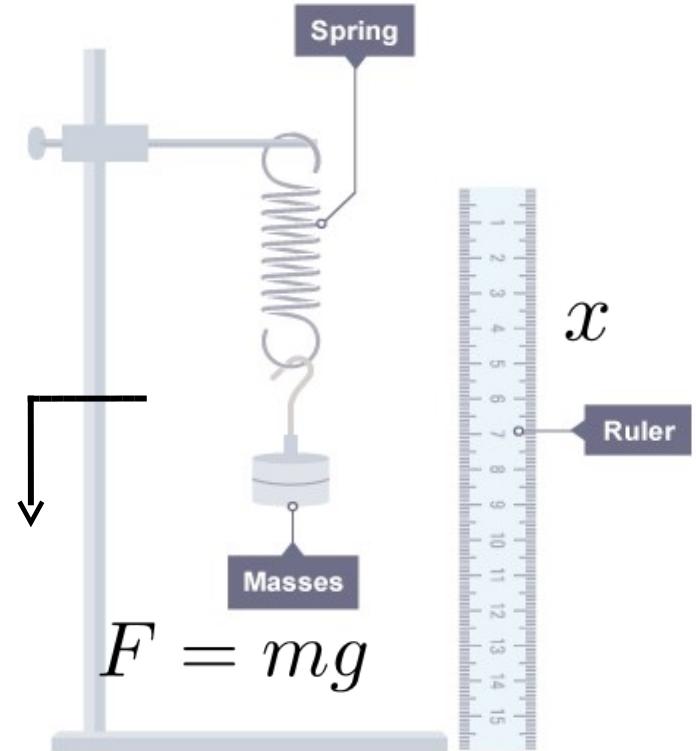

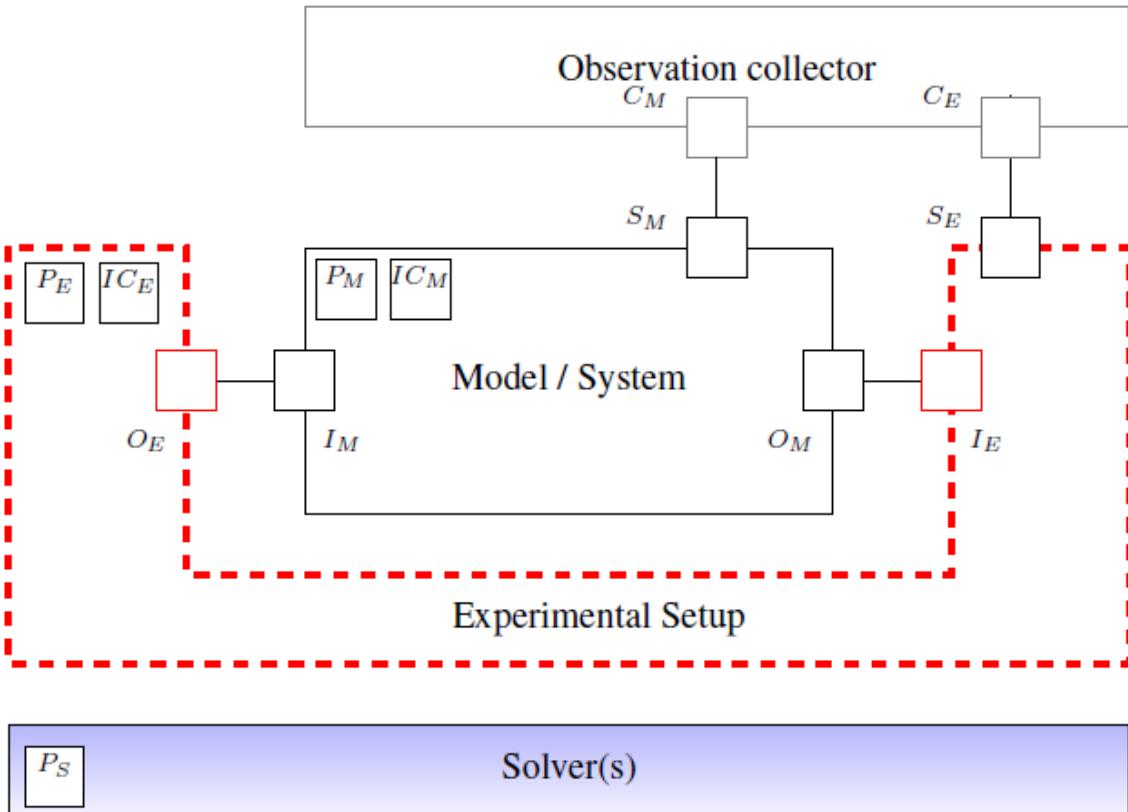

Experimental spring results, with mass  $m$  in  $kg$  and displacement  $x$  ( $\pm 0.0001$ ) in  $cm$

| $m$ | $x$    | $m$ | $x$    | $m$ | $x$     | $m$ | $x$     | $m$ | $x$     |

# A-Causal Modelling in Context

- Problem-Specific (technological)
- Domain-Specific (e.g., translational mechanical)
- (general) Laws of Physics
- Power Flow/Bond Graphs (physical: energy/power)
- Computationally a-causal  
(Mathematical and Object-Oriented) ← **Modelica**
- Causal Block Diagrams (data flow)
- Numerical (Discrete) Approximations
- Computer Algorithmic + Numerical  
(Floating Point vs. Fixed Point)
- As-Fast-As-Possible vs. Real-time (XiL)
- Hybrid (discrete-continuous) modelling/simulation
- Hiding IP: Composition of Functional Mockup Units (FMI)
- Dynamic Structure

| Dokumenttitel och undertitel<br>1810<br>A Structured Model Language for Large Continuous Systems  |   |
| Referat (sammendrag)<br>2010<br>A <u>model language</u> , called DYMOLA, for <u>continuous dynamical systems</u> is proposed. <u>Large models</u> are conveniently described <u>hierarchically</u> using a submodel concept. The <u>ordinary differential equations</u> and algebraic equations need not be converted to assignment statements. There is a concept, <u>cut</u> , which corresponds to <u>connection mechanisms</u> of complex types, and there are facilities to describe the <u>connection structure</u> of a system. A model can be manipulated for different purposes such as <u>simulation</u> and <u>static calculations</u> . The model equations are <u>sorted</u> and they are converted to assignment statements using <u>formula manipulation</u> . A translator for the model language is also included. |   |

# Equation-Based Object-Oriented Modeling Languages and Tools

[home](#) | [EOOLT 2017](#)

## News

### [EOOLT 2017](#)

The EOOLT workshop took successfully place in Munich, Germany on December 1.

Proceedings are now available on ACM Digital Library

### **Modelica Scalable Test Suite**

A new suite of scalable test models [can be found here](#).

## Welcome to the EOOLT community!

This site is intended to be a meeting point for researchers and practitioners working in the area of equation-based object-oriented modeling languages and tools. The site's main purpose is to host the workshop pages for the EOOLT workshop series. Below you can find links to the current and past events, together with links to the open access workshop proceedings.

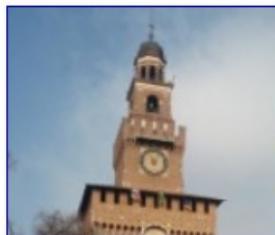

This site is maintained by [David Broman](#). If you have any questions or comments, please send an [email](#).

# MODELICA

# Multi-Domain Modeling

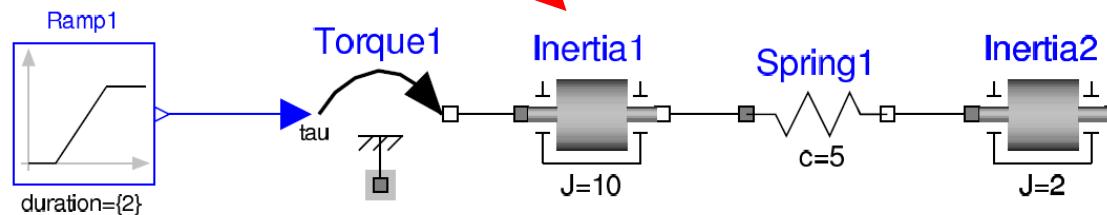

<http://www.modelica.org>

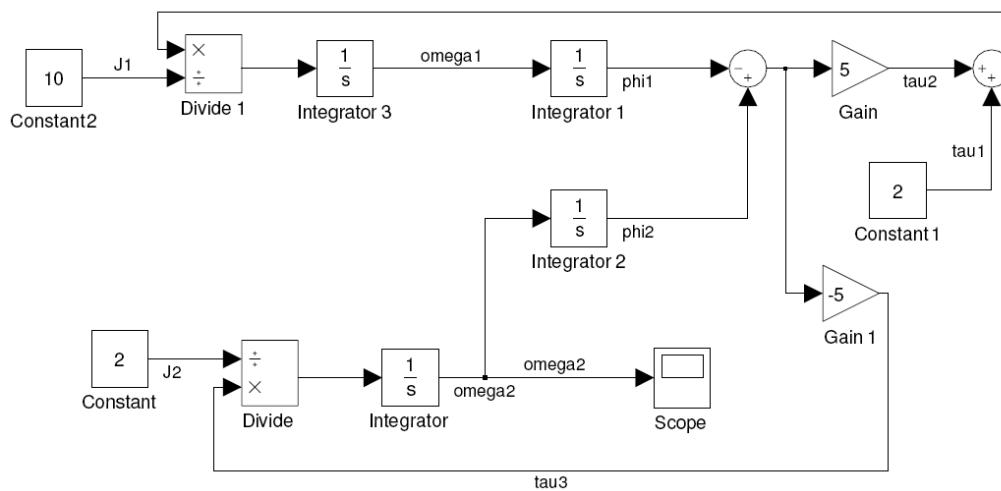

this slide from Peter Fritzson's Modelica tutorial

Keeps the  
physical structure

## Acausal model (Modelica)

## Causal block-based model (Simulink)

- Model exchange/re-use standard (Modelica Association)
- Modelica Standard Library (MSL)
- Object-oriented, hierarchical; semantics based on flattening
- Computationally a-causal modelling; semantics based on DAEs
- Originated in Hilding Elmquist's 1978 PhD thesis @ Lund
- Early 1990's: Modelica Design Team (started in SiE)

- hybrid (discrete-time/discrete-event) constructs (e.g., used to model network protocols based on TrueTime <http://www.control.lth.se/trueitime/>)
- Limited support for Dynamic Structure models (i.e., no “agents”)
- Separate model from its (numerical) solution ...
- Generate Functional Mockup Interface (FMI) compliant simulation units
- Currently: many commercial and open (e.g., OpenModelica) tools
- Related: Mathworks Simscape, EcosimPro, NMF, gProms, ...

## Electrical Types

```
type Time = Real (final quantity="Time", final unit="s");
type ElectricPotential = Real (final quantity="ElectricPotential",
                                final unit="V");
type Voltage = ElectricPotential;
type ElectricCurrent = Real (final quantity="ElectricCurrent",
                                final unit="A");
type Current = ElectricCurrent;
```

Beware: variables are **signals** (functions of **time**)!

## The circuit

```

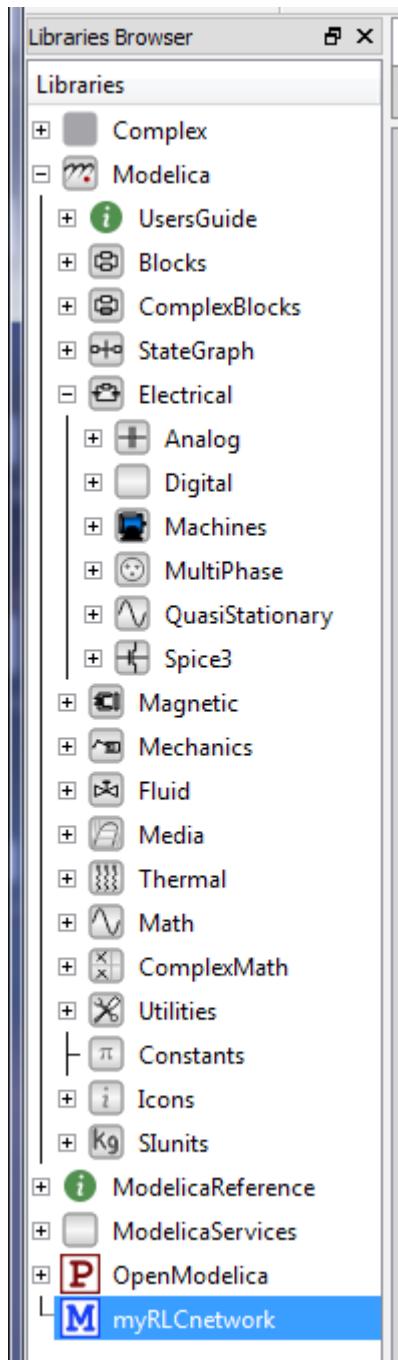

model circuit
  Resistor R1(R=10);
  Capacitor C(C=0.01);
  Resistor R2(R=100);
  Inductor L(L=0.1);
  VsourceAC AC;
  Ground G;
equation
  connect(AC.p, R1.p);
  connect(R1.n, C.p);
  connect(C.n, AC.n);
  connect(R1.p, R2.p);
  connect(R2.n, L.p);
  connect(L.n, C.n);
  connect(AC.n, G.p);
end circuit;

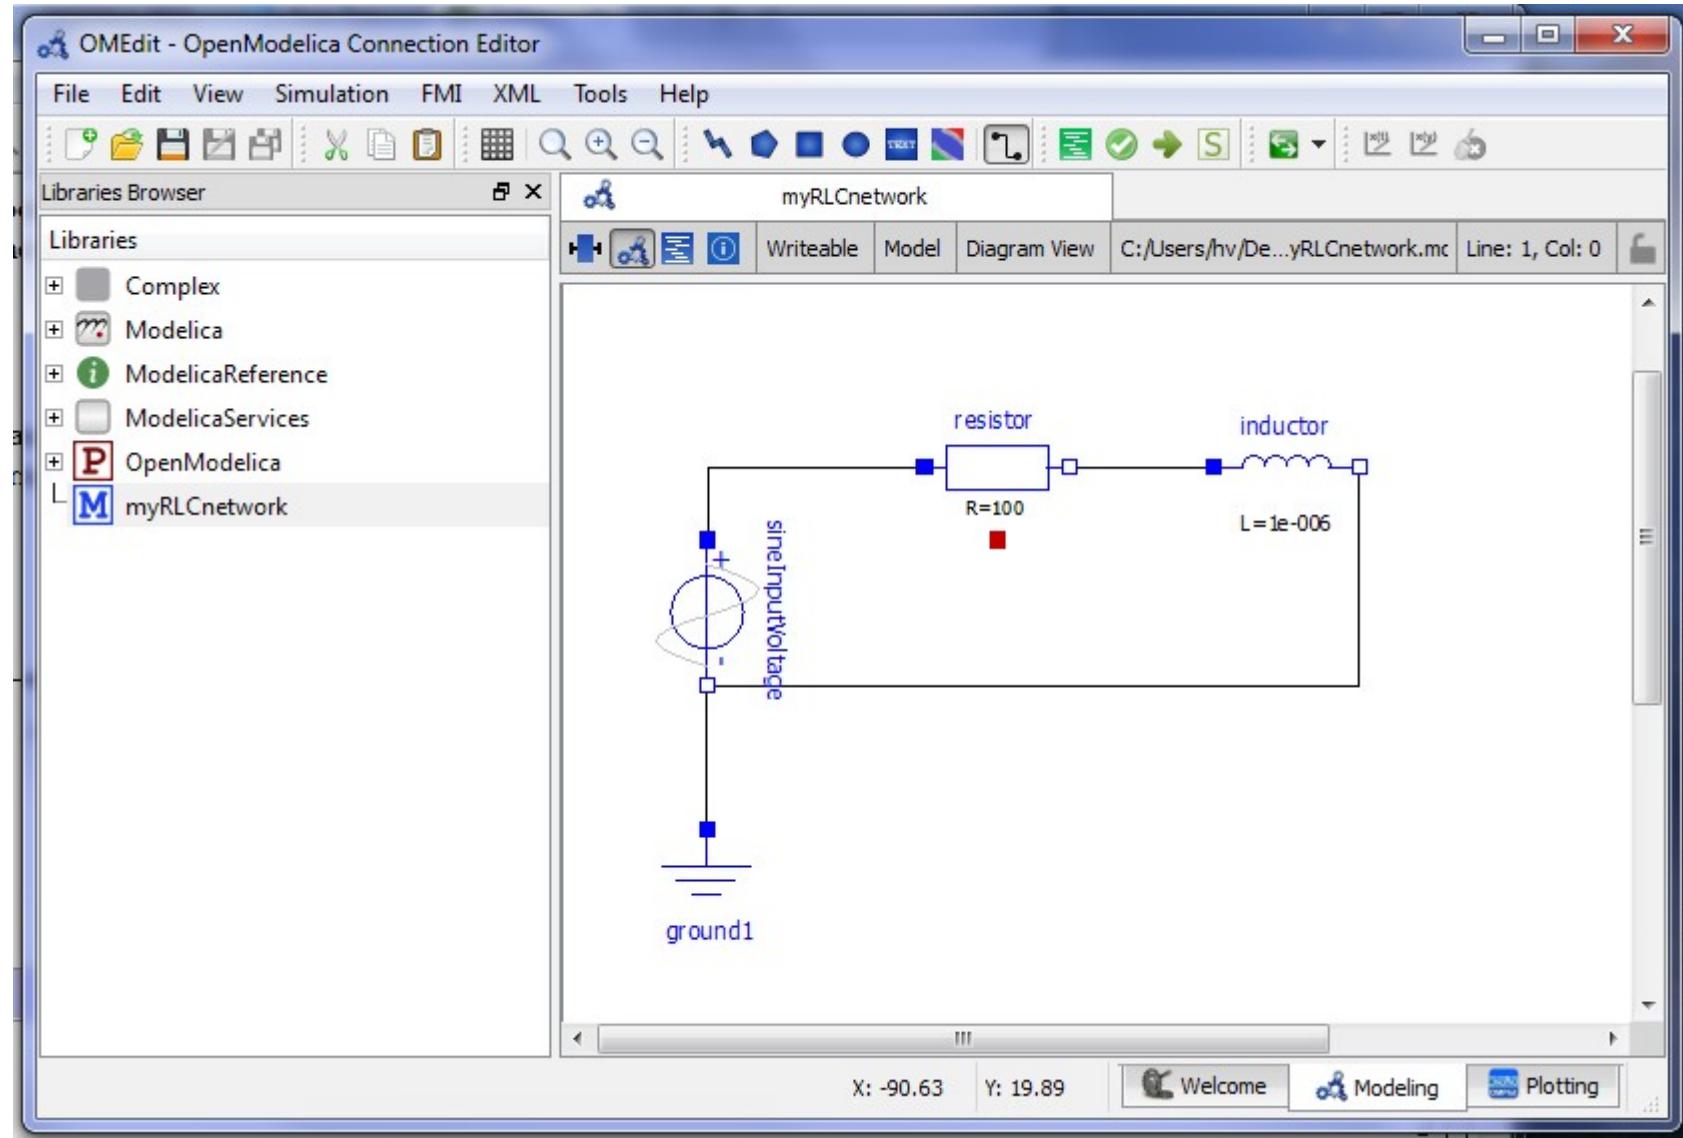

```

Meaning: set of Differential Algebraic Equations (DAEs) obtained by

1. expanding inheritance/instantiation
2. flattening hierarchy, unique names
3. expanding connect() into equations (across vs. flow)
